On Feb 26, 2002 this sequence version replaced gi:2995482.
Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Submitted (01-APR-1998) Human Genome Sequencing Center, Depar of Molecular and Human Genetics, Baylor College of Medicine, Baylor Plaza, Houston, TX 77030, USA 6 (bases 1 to 134019)

                                                                                                                                                                                                                                                                           New methods to produce heterologous recombinant proteins in urine require the use of a DNA molecule which is a kidney-specific promoter, such as the uromodulin promoter, operably linked to a heterologous gene encoding a biologically active protein. The uromodulin promoter expresses the heterologous gene in vivo in the kidneys to produce a recombinant biologically active protein in the urine. The recombinant proteins produced may be useful for treating human diseases. The major advantages of using this urine-based system over milk-based systems are the ability to harvest the product soon after birth and throughout the life of the animal irrespective of sex or reproductive status, and the ease of product purification from urine. In addition, livestock urine is a proven, currently utilised source of pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                        gene

                                                                                                                                                                                                                                                                                                                    The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

                                                                                                                                                                                                                                                                                           1051
                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

                                                                                                                                                                                                                                                                                                                            The present invention provides a number of single exon nucleic acprobes which are derived from genomic sequences expressed in the bone marrow. They can be used to measure gene expression in bone a samples, which may enable the improved diagnosis and treatment of such as lymphoma, leukaemia and myeloma. The present sequence is the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microcarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC probes: Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a calculeic acid expressed in the human lung; measuring gene expression in a cC sample derived from human lung, comprising (a) contacting the array with CC acids derived from human lung, comprising (a) contacting the array with CC mRNA, and (b) measuring the label detectably benome, comprising (c) contacting the array with CC (a) algorithmically predicting at least one exon from genomic sequences CC of the eukaryote; and (b) detecting specific hybridisation of detectably CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, CC having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, CC comprising (a) identifying exons from genomic sequence by the method can be added to the expression of the exons in the tissues and/or cell types using hybridisation to a single exon comprising one captures having a probe with the exon, where a common pattern of CC expression and for identifying exons in a gene; a peptide comprising one conditions of the exons should be assigned to a single gene; a peptide comprising one captures manalysis, and for identifying exons in a gene, particularly cusing human lung derived mRNA and for the study of lung diseases (CC pD), interstitial lung disease (ILD), familial idiopathic pulmonary disease (CC plumonary disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary collarsy dyshrinesis, pulmonary hypertension con the invention. The probes are a single exon can hypaline membrane disease. The present sequence is a single exon conditionary dysplasta, primary ciliarly dyskinesis, pulmonary hypertension of the printed specification, but was obtained in electronic.
                                                                                                                                                                                                                                                                                                                                 Query Match

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention also relates to fragments or the invention. The invention also relates to fragments or comman Schizophrenia gene. The invention also relates to fragments or the gene and the NRGIAGI polypeptides they encode. The CC variants of the gene and the NRGIAGI polypeptides may be used in the prevention, and treatment of diseases associated with inappropriate NRGIAGI CC diagnosis and treatment of diseases associated with inappropriate NRGIAGI CC with decreased expression by rectifying mutations or deletions in a CC patient's genome that affect the activity of NRGIAGI by expressing CC inactive proteins or to supplement the patients own production of CC NRGIAGI. Additionally, the gene may be used to produce NRGIAGI and CC culturing the cell to express the protein. The gene may also be used as CC DNA probes and primers in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which CC patients may be in need of restorative therapy. The NRGIAGI polypeptides CC NRGIAGI and in assays to identify modulators of NRGIAGI expression and CC activity. Anti-NRGIAGI antibodies may also be used as diagnostic agents for detecting the presence of NRGIAGI collapse the collapse of NRGIAGI is associated with schizophrenia which conserve the detection of antibodies may also be used as diagnostic agents for detecting the presence of NRGIAGI collapse of NRGIAGI is associated with schizophrenia which conserve the detection of antibodies may also be used as diagnostic agents for detecting the presence of NRGIAGI collapse of NRGIAGI is associated with schizophrenia which conserve the collapse of NRGIAGI is associated by the above methods.

This sequence represents the human neuregulin 1 gene of the invention. CC The invention also relates to fragments or variants of the neuregulin 1 cg gene. The gene and its proteins may be used in the prevention, diagnosis CC and treatment of diseases associated with inappropriate neuregulin 1 cexpression, such as schizophrenia. For example they may be used to treat disorders associated with decreased neuregulin 1 expression by rectifying cc mutations or deletions in a patient's genome that affect the activity of cneuregulin 1 by expressing inactive proteins or to supplement the patients own production of polypeptides. Additionally, the gene may be used to produce the neuregulin 1 protein, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The gene and its complementary sequences may also be used as DNA probes in claim of activity sequences may also be used as DNA probes in need of crestorative therapy. The protein may also be used as antigens in the ccl conduction of antibodies against neuregulin 1 and in assays to identify composities may also be used as antigens in the ccl candidators of neuregulin 1 expression and activity. The antibodies and composities and activity. The antibodies and activity composities and activity.
                                                                                                                                                                                                                                                                                                      Best

                                                                                                                                                                                                                                                                                                                       probe of the invention.

Note: The sequence data for this patent did not form part of printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid
                                                                       Probe #6940

The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systems. Cardiovascular disease, hypertension, cardiac arrhythmias and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1081 TAACACAAACTTAATAGATTAAAACAGCACGGATTTATTCTCACATGTTTTGAGACGCCA 1140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, pellepsy and cancers. The present sequence is one of the probes of the

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                     (MOLE-)
                                                                                                                                                                                                                                                                                                                                                                  15-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                              heterologous gene encoding a biologically active protein. The uromodulin promoter expresses the heterologous gene in vivo in the kidneys to produce a recombinant biologically active protein in the urine. The recombinant proteins produced may be useful for treating human diseases. The major advantages of using this urine-based system over milk-based systems are the ability to harvest the product soon after birth and throughout the life of the animal irrespective of sex or reproductive status, and the ease of product purification from urine. In addition, livestock urine is a proven, currently utilised source of pharmaceuticals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL101840-ABL16175) and the encoded proteins (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC AAH51601 represents a human genomic nucleotide sequence comprising sbg1, CC 934665, sbg2, g35017 and g35018 nucleic acid sequences located on the CC human chromosome 13g31-g3 locus. The nucleotide sequences contain CC biallelic markers and polymorphisms. Sequences AAH51602 - AAH51625 and CC AAB62907 - AAB62915 represent cDNA human sbg1 cDNA sequences and protein CC products. AAH51627 - AAH51631 and AAB62916 - AAB62918 represent g35018 CC CDNA sequences and protein products. Primers AAH51632 - AAH51639 are used to isolate sbg1 cDNAs, while sbg1 exons from different primates are cC represented by sequences AAH51642 - AAH51699. Nucleotide sequences of CC amplicons which comprise biallelid markers located on the chromosome CC 13g31-g33 locus are represented in AAH51819. Nucleotide sequences of CC primers AAH51818 and AAH51819 are used in the isolation of sequences of CC primers AAH51818 and AAH51819 are used in the isolation of sequences of CC used to determine the identity of the nucleotide at a biallelic marker in a sample DNA sequence. The nucleotide sequences may be labelled and used CC a sample DNA sequence. The nucleotide sequences may be labelled and used CC primers Halfelic marker in a biological sample from single or multiple Subjects. By determining the frequency of a biallelic marker in a copulation and association between a genotype and a trait, a haplotype and copulation and phenotype and a trait can be detected. The sequences can be used to determine a predisoposition to or early onset of schizophrenia or bipolar disorder or a beneficial response to or side effects related to creating the internal or bipolar disorder or a beneficial or bipolar disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

least 18 bases in length of a segment of chemically pretreated DNA (II) cof genes associated with development selected from 87 genes listed in the specification such as ACCPN, ADPN, or APD1 and comprising one of 350 CC sequences (ABN79984-ABN80333) or their complements. The invention is CC useful for the diagnosis or therapy of diseases associated with CC development genes, in particular disease related to homeobox containing CC genes (HOX), like diabetes, cancer, apoptosis related diseases, syndromes associated with congenital heart disease, epilepsy, diseases related to histone deacetylation, Currarino syndrome, diseases related to disconsist of the brain and limb girdle muscular dystrophy and dwarfism. CC development of the brain and limb girdle muscular dystrophy and dwarfism. CC in amplification of the 350 sequences, as primer oligonucleotides for the amplification of the 350 sequences, as primer oligonucleotides for CC single nucleotides for detecting the cytosine methylation state and/or single nucleotides for this patent did not form part of the printed specification but is based on sequence information supplied to Derwent by XX
                                                                                                                                                                                                                                                                                                             RESULT 5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprises (1) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (il) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analgesic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B) and agent has BBS5006-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.

       Polynucleotide having simple sequence repeat useful as markers plants for genetic characterization e.g. genetic mapping study, inheritance study of a commercially important trait in a plant
                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a loblolly pine Simple Sequence Repeat (SSR) locus. SSRs are also known as microsatellite DNA repeats. The present sequence is useful as a genetic marker for genetic mapping, population genetics studies and inheritance studies in various plant breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding
                                                                                                                                                                                                                                                                      Loblolly pine; Simple Sequence Repeat; SSR; microsatellite DNA repeat; genetic marker; mapping; inheritance study; population genetics study;

                The sequences given in AAQ55231-50 are derived from ribosomes of grapevine genus Vitis. These sequences represent the IGS region the ribosomal (r)DNA repeat and contain polymorphisms. These polymorphisms may be used in a method for the identification of different grape cultivars. These clones contain simple repeat sequences and were identified in a genomic library of grapevine using simple di-, tri- or tetra- nucleotide repeats such as (AT)
                                                                                                                                                                                                                                                                                                                                                                                                      Grapevine ribosomal clone INVGT19C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the gene encoding the rat apoptosis inhibitory factor PCTF35. The sequence was isolated from rat pheochromocytoma PC12 cells transformed with the human bcl12 gene. The protein can be used for the treatment of apoptosis-caused diseases, including those due to nerve cell death, e.g. Parkinson's disease and Alzheimer's disease.
                                                                                                                                                                 New protein obtained by culturing pheochromocytoma tbcl2 gene as a protooncogene, useful in remedies for apoptosis-caused diseases. e.g. Alzheimer disease

                                                                                                                                                                                                                                                                                                                                  hyperpoliferative disorders e.g. neephasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, viruses and fungia disorders e.g. corneal infection. The polypeptides can also caused by bacteria, viruses and fungia disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to cregenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Numerous examples of diseases and disorders treated by the nucleic acids and proteins are given in the specification. The present sequence is a genomic DNA fragment from a gene encoding a foetal antigen of the
                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polynucleotide (I) of the giant black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vannemei (ABM8097-ABM81172), both containing microsatellites sequences including those P. monodon microsatellite sequences given in GenBank AF077550-AF077598. (I), the complementary sequence or fragment and the encoded polypeptide are us for mapping of the genome of various species of shrimp. Mapping the genome of Penaeus is useful for determining whether a test shrimp, preferably Litopenaeus vannemei, has a genotype associated with a phenotypic trait such as resistance to Taura Syndrome Virus (TSV)
                                                                                                                                                                                             Giant black tiger prawn; Penaeus monodon; pacific whit Litopenaeus vannamei; shrimp; microsatellite sequence; Taura Syndrome Virus; TSV; infection; ds.

The method is useful for identifying pain-regulating substances (A) with analgesic activity. (A) along with nucleic acid (ABL8841-ABL88441) that encode proteins (B, ABB85006-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.
                                                                                                                                                                         1075

CC This is a murine interleukin-5 (IL-5) cDNA genomic fusion gene. This CC transgenic construct contain a chimeric pIL-5. EXPNNA sequence, comprising CC thymocyte/T cell, lung or basal keratinocyte specific transcription CC control sequence (TCS) and a segment encoding interleukin-5 (IL-5), which CC lacks endogenous 5'-control sequences when the TCS is thymocyte/T cell CC specific. The TCS is usually from a murine CD3delta gene. The chimeric CC DNA sequence is integrated into the genome and causes IL-5 to be CC expressed at a eosinophil related disease inducing level, specifically a CC expressed at a eosinophil related disease inducing level, specifically a CC expressed at a eosinophil related disease inducing level, specifically a CC genumonia, myalgia, Loffler's syndrome, allergy, emphysema, pulmonary CC fibrosis, Wagener's granulomatosis, adult respiratory distress syndrome CC (ARDS), bacterial or fungal infection, leukaemia, rheumatoid arthritis, CC antagonists which are potential therapeutic agents for an IL-5 associated disease to the both levels associated acceptable therapeutic agents for an IL-5 associated disease mbos mice constitution acceptable therapeutic agents for an IL-5 associated

The uromodulin promoter expresses the heterologous gene in vivo in the kidneys to produce a recombinant biologically active protein in the urine. The recombinant proteins produced may be useful for treating human diseases. The major advantages of using this urine-based system over milk-based systems are the ability to harvest the product soon after birth and throughout the life of the animal irrespective of sex or reproductive status, and the ease of product purification from urine. In addition, livestock urine is a proven, currently utilised contents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical eagent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 CC to ABL7010), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC anti-neoplastic agent, and can be used for producing a product which CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, breast, stomach, lung, thyroid, cesophageal, ovarian, kidney, prostate or panacreatic cancer, complanged, ovarian, kidney, prostate or panacreatic cancer, infiltrating ductal cancer, complanged, carcinoma, clear cell cancer, infiltrating ductal cancer, carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

             anti-neoplastic agent to be test
                                                                                        Screening for anti-neoplastic agent involves exposing cells to chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature generation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cancer; co

```
comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACAGAGTATGGTGTGGGCTACTCCTGTGACGCGGGTCTGCACGGCTGGTACCG

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a
                                                                                                                                                                                                                                                                                                                            28-SEP-2000

Expression of (I) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for diagnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology.

                                                                                                                                                                                                                                                                                                                                                             uromodulin promoter expresses the heterologous gene in vivo in the kidneys to produce a recombinant biologically active protein in the urine. The recombinant proteins produced may be useful for treating human diseases. The major advantages of using this urine-based systems are the ability to harvest the product soon after birth and throughout the life of the animal irrespective of sex or reproductive status, and the ease of product purification from urine. In addition, livestock urine is a proven, currently utilized source of pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New methods to produce heterologous recombinant proteins in require the use of a DNA molecule which is a kidney-specifi promoter, such as the uromodulin promoter, operably linked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13-NOV-1998;

       The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic frames are a thereau and chromosom marker procedures.
                                                                                                                                                                                          Claim
                                                                                                                                                                                                             New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo diagnostic, forensic, gene therapy and chromosome mapping procedu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          272
```

cDNA encoding the GX5401 antigen to identify clones encoding settensions of the GX5401 coding sequence. Several plaques reactive with the cDNA were identified. DNA from clone number 533 was sequenced. This analysis showed that the coding sequence in this clone overlaps with the GX5401 coding sequence and extends that sequence toward the N-terminal coding region. Analysis of the new sequence together with the GX5401 antigen coding sequence reveals an open reading frame encoding an Eimeria

Claim 10; Page 93 and Fig 14; 134pp;

The protein carries several repeated peptide sequences and is rich in cysteine residues. The open reading frame encodes a potential signal sequence for protein secretion. The coding sequence for this antigenic protein is given in AAN93324. Also new are an expression vector conty. the cloned gene, host cells transformed with the vector, and AP encoded by the cloned gene. The transformed cells are used in a vaccine to immunise birds against avian coccidiosis. By labelling the peptides, they can be used as a type-specific probe. The AP may also be used in an assay to detect Ab against the coccidia. The Abs are used to identify transformed cells conty.

The nucleotide or amino acid sequences are useful for in-vitro diagnosis of hereditary diseases cancer and for preparation of pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human genes, e.g. useful for diagnosis or

The nucleotide or amino acid sequences are useful for in-vitro diagnosis of hereditary diseases cancer and for preparation of pharmaceuticals.

                                                                                                                                                                                                                              The invention relates to a method of diagnosing (I) the onset or CC progression of benign prostatic hyperplasia (BPH), or screening (II) for CC or identifying an agent that modulates the onset or progression of BPH. CC The method is based on changes in gene expression in BPH tissue isolated from patients exhibiting different clinical states of prostate CC hyperplasia as compared to normal prostate tissue. (I) comprises CC detecting the expression levels of one or more genes in prostate cells from the subject that are differentially regulated compared to normal CC prostate cells. (II) comprises preparing a first gene expression profile CC agent, preparing a second gene expression profile CC agent, preparing a second gene expression profile of the agent exposed CC (I) is useful for diagnosing the onset or progression of BPH. (II) is CC (I) is useful for diagnosing the onset or progression of BPH. (II) is compression level in a tissue or cells, by comparing the expression CC level of genes given in the specification in the tissue or cells to the CC expression level in a tissue or cells, by comparing the expression CC level of expression of gene in the database, and displaying the CC expression levels of at least one gene in the tissue or cell sample CC expression prostate cancer. ABK64106-ABK64860 represent human CC benign prostatic hyperplasia gene sequences of the invention.

The present invention describes a method (M1) for screening for an C anti-neoplastic agent. The method involves exposing cells to a chemical eagent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in AbL61664 CC to AbL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, breast, stomach, lung, thyroid, CC easophageal, ovarian, kidney, prostate or pancreatic cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, carcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.
Human; tumour suppressor gene; oncogene; antitumour; cancer; tumour; CpG dinucleotide; single-nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 3198 BP; 900 A; 657 C; 757 G; 884 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; SEQ ID 3219; 44pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a nucleic acid comprising a sequence of 18 CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and composition of genes associated with tumour suppression and composition and sequence taken from 536 (actually 533 since concogenes having a sequence taken from 536 (actually 533 since committees and 500 are missing from the sequence listing) sequences committees and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may complementary to (Ss). The nucleic acid may be a complementary to genetic detecting the cytosine methylation state committees and tumours. The probes for detecting the cytosine methylation state composition and penetic and/or epigenetic parameters for the diagnosis complementary to epigenetic parameters for the diagnosis complementary to specific compared to another set of genetic and/or epigenetic parameters, the compared to another set of genetic and/or prognosis events which care disadvantageous to pattents. The present sequence is one of the composition of the parameters and the parameters and complements and the parameters and complements. The present sequence is one of the composition of the parameters and the parameters and composition are disadvantageous to pattents. The present sequence is one of the composition of the parameters and the parameters and composition of the parameters.
